When it comes to graphing a function, we say there are two sets R and R (R - set of Real numbers), we take the cross products which results in a plane like Cartesian Plane. But is it the same or different? It has X and Y co-ordinates. We can draw a curve here too. We just don't relate the points, we relate them such that y is the unique image of x.

The Cartesian plane is composed of two perpendicular axes. Their intersection defines the origin of the plane. Each axis is graduated starting from the origin. The horizontal axis is the abscissa axis (also known as the "x axis"). The vertical axis is the ordinate axis (also known as the "y axis"). These axes divide the cartesian plane into four quadrants.
