THE CELL CYCLE The cell cycle, or cell-division cycle, is the series of events that take place in a eukaryotic cell between its formation and the moment it replicates itself. These events can be divided in two main parts: interphase (in between divisions) and mitosis. Interphase is divided into three phases: G₁ phase, S phase, G₂ phase.

Cell Cycle Reading Guide The Cell cycle

The cell cycle is the life of a cell from the time it is first formed from a dividing parent cell until its own division into two daughter cells. Concept 12.1 Most cell division results in genetically identical daughter cells. 3.

species the length of the cell cycle determines how long it takes to replace damaged cells. The duration of the cell cycle varies from organism to organism and from cell to cell. Certain fly embryos sport cell cycles that last only 8 minutes per cycle! Some mammals take much longer than that--up to a year in certain liver cells.
